

# Laravel 8 - IMPORTANT UPDATE

## Laravel 8 Update

On the lecture called "Routing Controllers" I show you how to route your requests using a controller. Laravel recently updated this feature and the code changed.

You are going to see me, using a code similar to this below

```
1. Route::get('/', 'HomeController@index')
```

Every time you see that code, you need to change it to something similar to the ones below

```
Route::get('/checking', '\App\Http\Controllers\HomeController@index');
```

As you can probably tell, now we have to include the whole path of that controller in the method.

## OR

You can also use the one below, which I like best.

```
1. use App\Http\Controllers\HomeController; //  
2.  
3.  
4. Route::get('/', [EdwinsController::class, 'index']);
```
